Configuring the IDE	4

Background

This initialization lab will provision you with an AWS account and access to the AWS console via your local web browser. It will also provision a Cloud9 instance that will act as your Integrated Development Environment (IDE). This initialization lab should be run at the start of each day or if you inadvertently end your lab prematurely during the day.

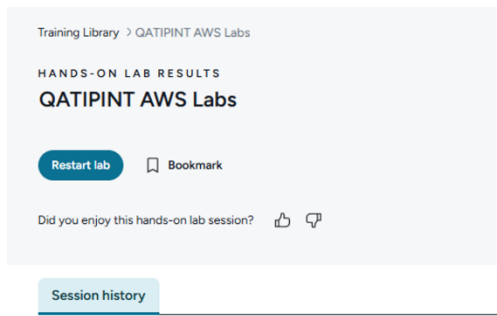

Accessing the lab environment

1. Access your QA Platform session booking via MyQA links that should have been emailed to you.
2. Two lab booking should have been made for you, one for AWS based labs and another for Azure based labs. This document assumes that AWS is your preferred Cloud provider, so follow the link to the 'QATIPINT AWS Labs'
3. If necessary, complete pre-requisite checks before selecting 'Access the lab'...

4. Click Start/Restart lab ...

5. This starts the process of provisioning your lab resources. An estimated amount of time to provision your lab resources is displayed. You must wait for your resources to be provisioned before continuing. Once initialized, information regarding your provisioned AWS environment will be displayed (your Lab title and Credentials will differ)...

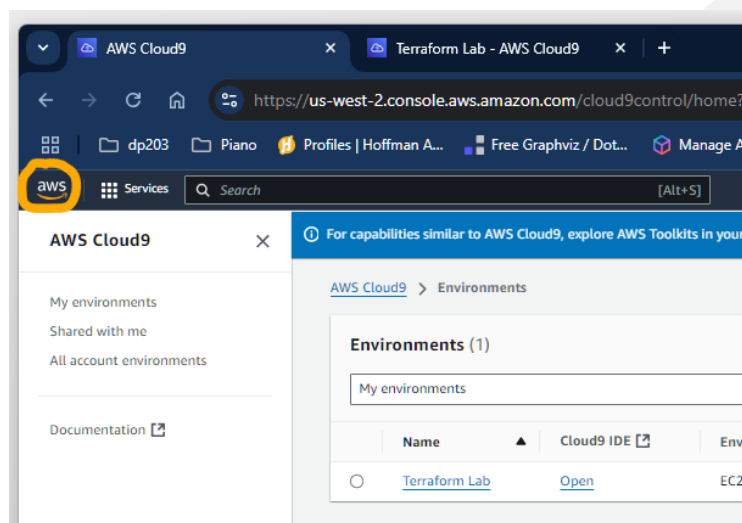

6. Accessing AWS can either be by using your own local web browser or, if provided, by using a web browser on the provided 'Bridge' virtual machine. The Bridge is intended for those attendees who have outbound network restrictions on their local machine, especially SSH. It is recommended that you only use the Bridge if and when you encounter issues when using your local browser.
7. Follow the provided Step 1. 'Logging in to the Amazon Web Services Console' instructions using the provided credentials.

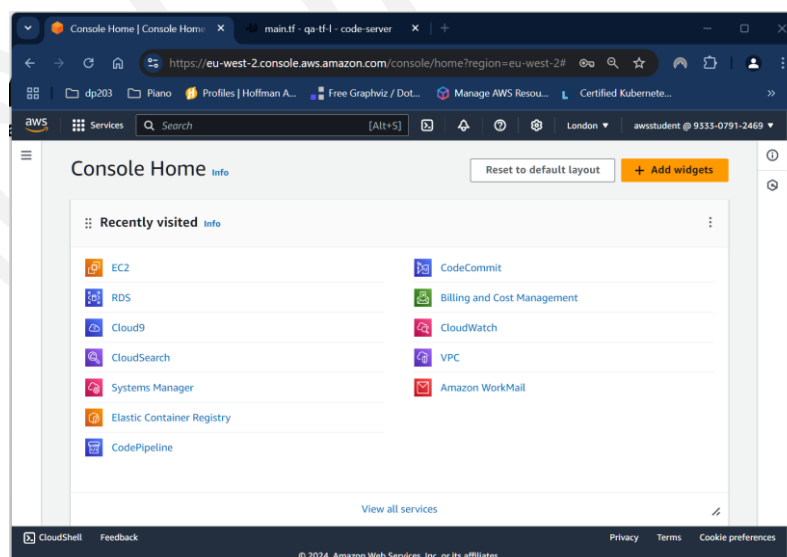

- Follow the provided Step 2. 'QATIP Starting the Labs' instructions carefully, especially the section on turning off managed temporary credentials.
- Do not** Select 'Submit' in Step 3. 'QATIP Labs: Finishing the Labs' unless you wish to destroy all of your lab resources.

Finalizing your lab environment

- On the AWS **console** tab click on the AWS logo to return to Console Home...

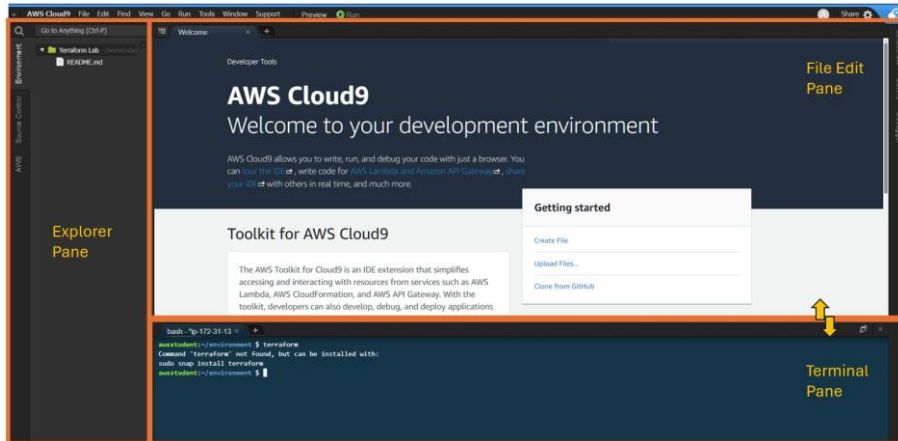

- This tab will be referred to as '**the console**' throughout all labs...

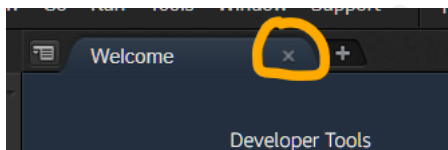

- The second tab is your Cloud9 IDE, and it is here where you will write and run your terraform code. Throughout the labs, this will be referred to as **'the IDE'**

....

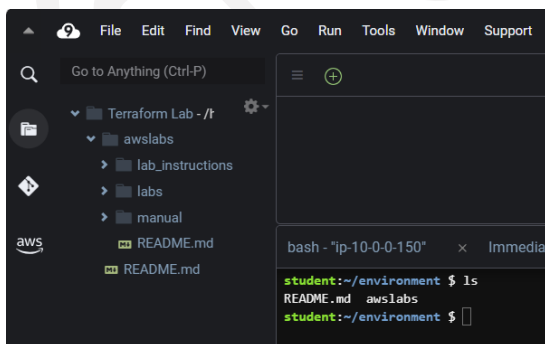

Configuring the IDE

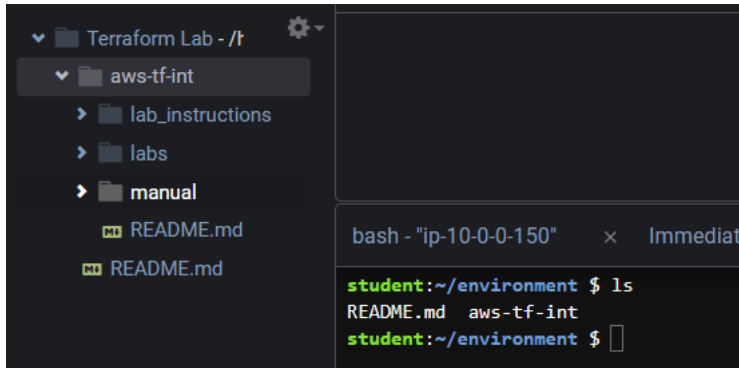

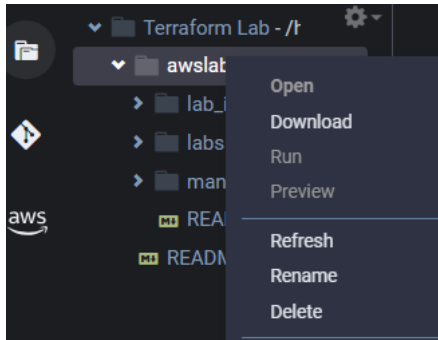

- In the IDE, close the Welcome page...

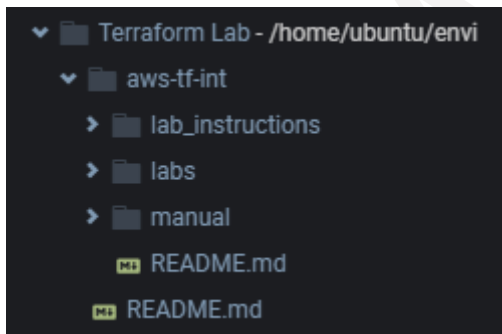

- The lab repository has been cloned into your Cloud 9 instance under `~/environments/awslabs`

- To align with lab instructions, rename this directory to **'aws-tf-int'**...

- The directory **aws-tf-int** contains sub-directories for lab files, lab instructions and the course manual. These can be viewed in the Explorer pane...

- To install the Terraform client, enter the following command into the terminal...

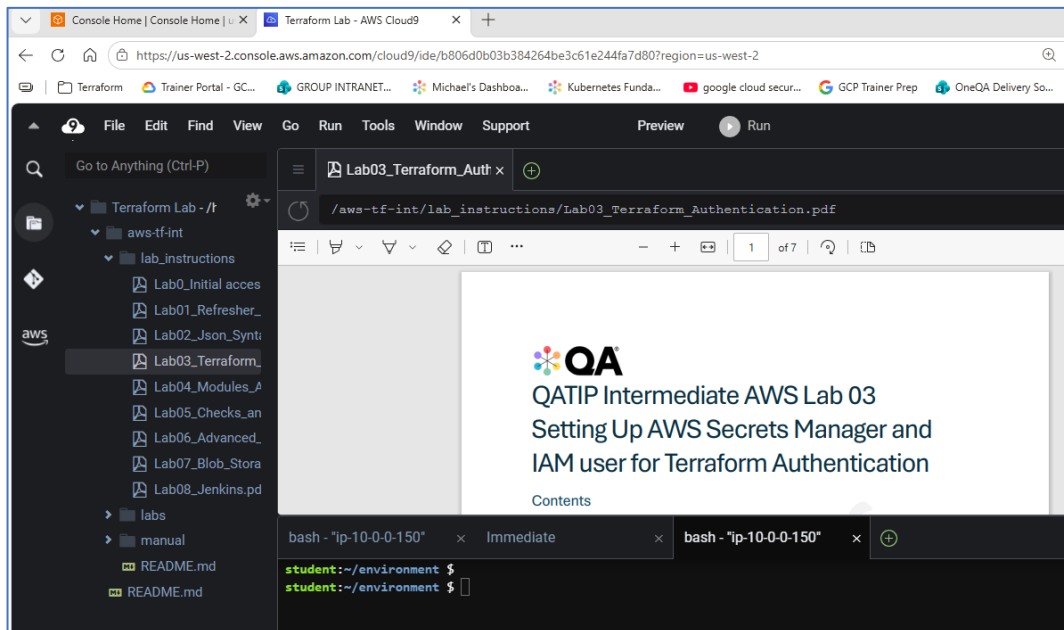

```
sudo snap install terraform --classic
```

- To verify the installation, type the following command ...

```
terraform -version
```

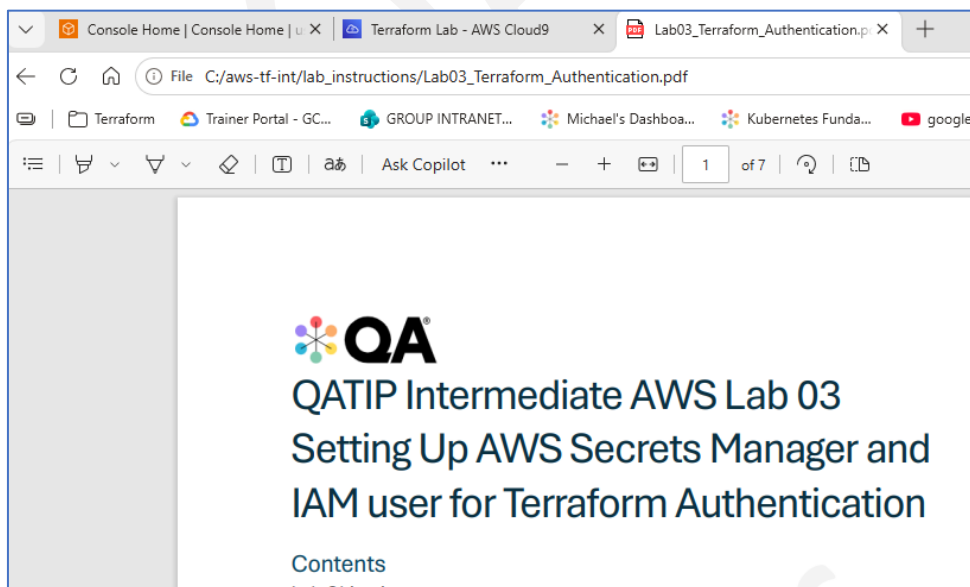

- Cloud9 supports displaying PDFs. When attempting a lab, you can open the lab instructions within the IDE. You can also copy and paste between the PDF and the IDE terminal. Therefore, you can run this entire course through a

single browser session with two tabs, one focussed on the AWS console to view your resources and the other focused on the IDE, in which you can read and perform your labs...

8. An alternative would be to clone the lab repo locally and then view the instruction pdfs through your local browser.

git clone <https://github.com/qatip/aws-tf-int.git>

***** This concludes the initial setup lab *****
